

Reflection Journal 2.3

- 1) Models are the core of django code. It is how the code interacts with the database and the information. The models are the structure of the application and make implementing the tables and apps easy for the developer.
- 2) Test cases are crucial to add from the start of the project because it is a lot easier to fix problems and errors while you code rather than have a ton of errors after you already implemented a bunch of different features. If you implement something incorrectly it could make it extremely difficult to have to go back and change a ton of code that would have been easier to fix right at the beginning. Some errors and mistakes can take effect on all the other code you write.
