

## Exercise 2.8 Reflection

- 1) You can use static files to place CSS and JS to use inside your django project. You can then load the static files throughout your project. Storing your static files together allows for everything to work.
- 2) You can use a first test and use local servers to run and work on your project. This helps with tests before publishing to a run server such as Heroku that allows for all users across the web to find your project. There are many different services that allow for you to do this and certain ones are better for certain projects than others.
- 3) I learned a lot from this course. It took longer than anticipated with some roadblocks along the way but I am excited to continue my journey to get to where I want to go. I know that this is the end of learning here but I have so much to learn in the future. I think I have a good base of everything I need to know but now is when I start to master certain skills to help with future jobs. I am happy with some projects such as the meet app and the portfolio I started working on. There were many difficult aspects to this journey but I think I overcame most of the obstacles I came across. Thanks!!
