Journal 2.1

1) Vanilla Python would be great for a smaller project that needs a lot of free room. Django has limitations that it doesn't allow you to stray away from and these sometimes could cause issues. If you don't need a database also django may not be needed.
2) MVT has a template and makes all the flow of data super easy and straightforward. A lot of the code is done for you and you can focus on the visualization. MVC would allow for the programmer to have more control on how the flow of data works. This requires a lot more code to write.
3) I feel like learning React allowed me to understand JS a lot more. I believe that it might be the same for Django. My goals would be:
   - Understand how Django works with databases and the flow of it all.
   - I want to fully understand what differentiates django from vanilla python. (What needs to be coded)
   - I could see myself recreating a smaller scaled instagram or youtube application.
